Katsuhiko Hirose, Toyota's Fuel Cell Development Group general manager, claims that it is up to the car makers to produce attractive and increasingly cleaner vehicles. However, he stresses, the help of others is needed to ramp up the availability of hydrogen.

From the article: "Automobile manufacturers can solve problems by working hard if only the challenges are related to fuel cell cars, whereas the diffusion of hydrogen stations cannot be realized only by automobile manufacturers, he stressed. To make the miracle come true, he called for cooperation of energy companies and the government toward the diffusion of hydrogen stations."

We've heard that same message just a few days ago from General Motors. And a bit longer ago from the Fuel Cell and Hydrogen Network in North-Rhine Westphalia (links below).
